# HONG KONG UNIVERSITY OF SCIENCE AND TECHNOLOGY DEPARTMENT OF CHEMICAL AND BIOMOLECULAR ENGINEERING

# Multi-functional Gel Materials for Malodor Treatment

Work Plan: 17042

Researcher: FAN Yuwen

Supervisor: Prof. YEUNG King Lun

Work plan Number: Date: 20th June 2017

#### 1. General Information

Name of Researcher:

FAN Yuwen

Name of Project Supervisor:

Prof. YEUNG King Lun

Project Title:

Multi-functional Gel Materials for Malodor

Treatment

Research Area:

Advanced Materials and Environment

Location:

Rm. 7253 and 6115

Proposed Start Date:

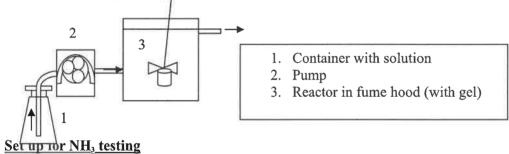

20th June 2017

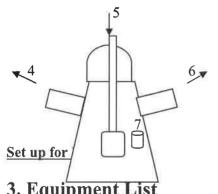

#### 2. Experiment/Project Description

#### **Project Description:**

Malodor is an important class of air pollution that has a serious threat to personal health and quality of life. It also has an adverse impact on commerce and property values, and promotes a negative image of poor sanitation. Hydrogen sulfide and ammonia gases are two major causes of malodor complaints in Hong Kong and are produced by microbial decomposition of organic wastes. They are often found in waste treatment and handling facilities, landfills and indoor at lavatories and wet markets. Sewer is also a major source of malodor in urban environment and is particularly different to be treated. This project proposes a noncatalytic technology based on controlled-release of biocide, inhibitor and zeolite will also be developed to address the malodor problem at the source by killing odor-causing microbes, inhibiting odor generation and adsorb malodor compound.

A schematic diagram of the experimental setup is drawn as below. Low concentration of NH<sub>3</sub> in water phase is used in the experiment and the testing equipments are put outside of fume hood, while the H<sub>2</sub>S experiment will be conducted in the fume hood.

- 1. Water sampling
- 2. H<sub>2</sub>S in Ar inlet
- 3. Gas sampling
- 4. Reactor in fume hood (with gel)

## 3. Equipment List

| Equipment |                     | Location |
|-----------|---------------------|----------|
| 1)        | Pump                | 7253     |
| 2)        | pH meter            | 7253     |
| 3)        | UV-Vis spectrometer | 6115     |
| 4)        | Ion chromatography  | 7101     |
| 5)        | GC-MS               | 6115     |
| 6)        | TOC                 | 7101     |
| 7)        | ICP                 | 7101     |
| 8)        | H₂S analyzer        | 6115     |

#### 4. Experimental Procedures

A polluted solution is simulated and introduced into a reactor with a hydrogel placed in it. Adsorption or reaction of NH<sub>3</sub> and H<sub>2</sub>S are controlled by the flow rate of pollutant. This reaction is taken place at ambient pressure and temperatures to find out the optimum formulation of hydrogel to remove the pollutant effectively. The aim of the reaction is to adsorb, convert NH<sub>3</sub> and H<sub>2</sub>S into nontoxic substance.

#### 4.1 Hydrogel Preparation

The hydrogel, is prepared by mixing TEOS with metal chlorides, thymol, sodium chlorite and ion exchange zeolite. The mixture is stirred by magnetic bar for an hour to get a well-mixed solution with mild heating (60C) and the presence of dilute HCl. Dropwisely add AS-40 (colloidal silica) into the resulting solution and stirred for 30 minutes. The solution is then poured into a container for gelation overnight.

#### 4.2 Flow Reactor

The reactor is made of transparent and the NH<sub>3</sub>, H<sub>2</sub>S gases or bacteria (S. Aureus, E. Coli, H<sub>2</sub>S generating bacteria or NH<sub>3</sub> generating bacteria) in water phase are introduced into the system. NH<sub>3</sub> in water phase is using dilute ammonia solution while H<sub>2</sub>S in water phase is using dilute sulfide ion solution (e.g. sodium sulfide). The flow rate of pollutants is controlled using the pump.

Samples are taken from the outlet and can be analyzed by pH meter, ion chromatography and UV-vis spectrometer.

#### 4.3 Analysis

#### (a) Concentration Analysis

The concentration of the pollutant in the outlet stream is measured by ion chromatography and pH meter after collecting the water sample. The sample is taken after one volume change of the reactor and every hour.

UV-vis is used to analyze the total arbitrary amount of ion exchange zeolite and other colored compounds release. Water sample will be taken at the inlet and outlet as control and testing group with respectively for comparison.

#### (b) Bacterial Analysis

Water sample taken at the outlet is spread onto the agar plates and incubated for one day to count the total bacteria number on the plates and calculate the bacterial reduction efficiency.

#### 7. Operating Conditions

#### Preparation of hydrogel

• Pressure : atmospheric during preparation

• Temperature : ambient temperature

• Flow rates : batch operations therefore not applicable

#### Preparation of Zeolite

• Pressure : atmospheric during preparation

• Temperature : 450-550 °C

• Flow rates : batch operations therefore not applicable

#### H<sub>2</sub>S System

• Pressure : atmospheric

• Temperature : ambient temperature

• Flow rates : 1-10 ml/min

#### NH<sub>3</sub> System

• Pressure : atmospheric

• Temperature : ambient temperature

• Flow rates : 1-10 ml/min

#### **Bacterial System**

• Pressure : atmospheric

• Temperature : ambient temperature

• Flow rates : batch operations therefore not applicable

#### 8. Services List

Electricity (AC 220V, 50Hz)

Double de-ionized water

Tap water

#### 9. Chemicals List

| Chemical                 | Purity  |

| NaClO <sub>2</sub> | Eye, skin, ingestion or inhalation irritation | Reactive with reducing agents, combustible materials                        |
| TEOS               | Eye, skin, ingestion or inhalation irritation | Oxidizers and strong acid   |
| AS-40              | None  | none  |

#### 12. Waste List

The inlet NH<sub>3</sub> and Na<sub>2</sub>S concentrations to the reactor are low and the waste water could be neutralized before disposal.

#### 13. Assessment of Significant Risks

Some of the chemicals used in the experiments are irritating (NH<sub>3</sub>) and toxic by ingestion, skin contact and inhalation. All of the used solvents and NH<sub>3</sub> are flammable and at least harmful if not toxic and must be disposed.

#### 14. Safety Precautions

(i) Personal protective equipment

A lab coat and UV protective goggles must be worn through the experiment and nitrile gloves must be worn while handling, transporting and transferring chemicals.

(ii) Fume Extraction System Required and in Place:

The reaction system is running at low concentration and in water phase, the volatility of the pollutant should not be high. For H<sub>2</sub>S setup, the reactor will be placed in fume hood.

- (iii) Specific Containment Procedures: Reactor covered by aluminum foil.
- (iv) Specific Training Required: None.
- (v) Specific Supervision Required: None.
- (vi) Specific Monitoring Required: None.

## 15. Action in Case of Abnormal or Emergency Situations

(i) Service Failure

Close the main valve on the air cylinder and reactant inlet.

#### (ii) Action in case of fire or explosion

#### 1. When hear the fire alarm:

- Remain calm and check if there is any sign of fire in the vicinity.
- If you see fire or smoke, or hear the announcement asking you to evacuate, follow the evacuation procedures below.
- If there is no sign of a fire, stay alert and pay attention to announcement until the fire alarm is silenced.
- Evacuate if the alarm has sounded for more than two minutes.
- If you hear the buzzer sound which indicates fire alarm is activated in an adjacent fire zone, stay alert and pay attention to announcement.
- If you hear both the buzzer and the fire alarm, you are near the boundary of fire zones, treat as if you hear the fire alarm.

#### 2. If discover a fire:

- Activate the fire alarm by pressing the break glass fire alarm button.
- Report to Security Control Centre by dialing 8999.
- Alert other people. If SAFE to do so, try to put out the fire by firefighting equipment.
- DO NOT take any personal risk. If the fire gets beyond your control, evacuate immediately by following the procedures below.
- Close the door of the room on fire.

#### 3. When there is a fire and need to evacuate:

- Remain calm. Walk; do not run, especially when travelling on staircases.
- Immediately leave the building and go to the assembly point using the nearest exit.
- Try to help those who may have difficulties travelling such as disabled and pregnant persons.
- DO NOT USE THE LIFTS.
- Report to your Fire & Safety Officer at the assembly point as far as practicable.
- Do not return to the building until permission is given by the Fire Services Department Officer in charge of the scene.

#### (iii) Action in case of spillage

#### 1. Hazardous Chemical Spill in a Research Laboratory:

- Alert co-workers.
- If safe to do so,
  - 1. Confine the spill with appropriate materials.
  - 2. Turn off remotely all heat/ignition sources if flammable vapor is involved.

Ask for assistance if necessary.

Press the Emergency Ventilation button (do not activate this button in case of fire).

Inform the Security Control Centre by dialing 8999 from a safe location.

Evacuate everyone in the affected area. Leave contaminated clothing and close the door.

Activate local warning system to prevent others from entering the room.

If possible, maintain a safe distance from the scene, keep the entrance or access routes in sight and help to prevent entry to the affected room.

If conditions allow, remain to assist the emergency response team.

#### 2. Radioactive Material Spill:

- Alert co-workers.
- If safe to do so, confine the spill with appropriate materials.
- DO NOT activate Emergency Ventilation UNLESS radioactive gas or vapor (e.g. Iodine-125) is involved.

- Inform the Security Control Centre by dialing 8999.
- Evacuate everyone in the room.
- Leave contaminated clothing or articles and close the door.
- Activate local warning system to prevent others from entering the room.
- If possible, maintain at a safe distance from the laboratory, keep the entrance or access routes in sight and help to prevent entry to the laboratory.
- If conditions allow, remain to assist the emergency response team.

#### **Decontamination Procedures**

- Persons contaminated by radioactive material should go through decontamination as soon as they arrive at a safe location.
- Treat any injury first. First-aiders should protect themselves against contamination.
- Remove any other suspected contaminated clothing or articles, seal in a plastic bag.
- Wash contaminated skin area with water and detergent. Avoid aerosol generation (e.g. scrubbing with brush).
- Immediately seek medical attention for any internal contamination.

#### 3. Biohazardous Material Spill:

- · Alert co-workers.
- If safe to do so, contain the spill with appropriate material.
- If the spill occurred in a biosafety cabinet, leave the unit on.
- Evacuate everyone in the affected area.
- Leave contaminated clothing or articles and close the door.
- Inform the Security Control Centre by dialing 8999 from a safe location.
- Activate local warning system to prevent others from entering the room.
- If possible, maintain a safe distance from the laboratory, keep the entrance or access routes in sight and help to prevent entry to the laboratory.
- If conditions allow, remain to assist the emergency response team.

#### **Decontamination Procedures:**

Any person contaminated by the biohazardous material spill should go through decontamination as soon as they arrive at a safe location.

- Treat any injury first. First-aiders should protect themselves against contamination.
- Remove any other suspected contaminated clothing or articles, seal in a plastic bag.
- Wash contaminated skin area with water, appropriate disinfectant and soap.
- If eyes have been contaminated, flush with water.
- Immediately seek medical attention for any internal contamination.

#### 4. Hazardous Chemical Spill in a Teaching Laboratory:

Students or technicians upon discovering a chemical spill:

- Alert all persons in the vicinity.
- Inform the person in-charge in the laboratory.

Person-in-charge upon notification of a chemical spill:

• If safe to do so,

Confine the spill with appropriate materials.

Instruct the students to turn off remotely all heat/ignition sources if flammable vapor is involved.

- Press the Emergency Ventilation button (do not activate this button in case of fire).
- Evacuate everyone in the laboratory, leave contaminated clothing and close the door(s).
- Inform the Security Control Centre by dialing 8999 from a safe location.
- Activate local warning system to prevent others from entering the area.
- If possible, maintain a safe distance from the scene, keep the entrance or access routes in sight and help to prevent entry to the affected laboratory.
- If conditions allow, remain to assist the emergency response team.
